

Advance is pleased to announce a very liberal trade-in program on your older sprayers or ladlers.

In 1978, Advance began manufacturing its line of servo-controlled automation equipment. In the dynamic world of electronic technology, that's an exceptionally long time.

Many of these older electronic components have been out of production for several years. Additionally, there have been three major control revisions in the past 25 years, simply because certain electronic manufacturers either discontinued an entire product line or left the business completely.

For the benefit of our customers, and in spite of these many factors that were beyond our control, we have continued to support our old automation products—as long as we could get components rebuilt in a timely and economical manner. Unfortunately, this is becoming increasingly difficult with each new day.

Whenever possible we will continue to repair your older reciprocator or ladler components but we strongly suggest you consider trading in your older equipment toward the purchase of a new Advance system, employing the latest technology. You'll gain efficiency and productivity and the more modern control technologies will provide superior reliability with significantly reduced maintenance costs.

Advance's revised, liberal trade-in program will enable you to get a new highly productive piece of equipment, at a great price. Trade-in credits range from \$5,500 to \$7,500 depending upon the model of sprayer or ladler and its control configuration. That means we're crediting you 25% to 33% of your original cost—not bad for a 20-year-old piece of equipment! Isn't it time to step up to a new model? Please call our sales department for a free, no-obligation quotation and more information.
